

**OC-X87XXXXX Series**  
Micro-miniature OCXO

**Features**

- Low Cost DIL 14 package
- High Vacuum Sealed Crystal
- Low Power Consumption (500 mW)
- Fast Warm-up Time (2 minutes)
- Stratum3 or better Stability
- Low Aging < 3 ppm over life
- Very Low Phase Noise (-160dBc/Hz TYP)
- HCMOS/TTL or Sine-Wave output
- 8 MHz to 160 MHz Frequencies Available
- Voltage Control Optional

**Applications**

- Telecommunications
- Data Communications
- Instrumentation

Notes:

1\* Higher frequencies can be achieved either by using higher frequency crystals or by low noise analog harmonic multiplication. Both methods have advantages and drawbacks. If lowest possible phase noise on the noise floor is most important – high frequency crystal will be used. If phase noise close to the carrier and aging are more important – multiplication will be used. Please consult factory for your specific requirement.

2\* Phase noise deteriorates with frequencies going higher. If analog multiplication is used to achieve higher frequency the phase noise roughly follows the formula of additional 20LogN, where N is a multiplication factor across entire frequency offset range. If higher frequency is achieved by using higher frequency crystal phase noise close to the carrier deteriorates due to the lower Q of the crystal and is usually worse, compared to multiplied solution. On the noise floor, however it remains more or less the same.
