

OVERVIEW

The SM6702 series are step-up DC/DC converter ICs, fabricated using NPC's Molybdenum-gate CMOS process. They incorporate reference voltage source, error amplifier, oscillator, start-up circuit, PFM (Pulse Frequency Modulation) control circuit into a single chip. The only external components required are a Coil, Diode and output smoothing capacitors to form a step-up DC/DC converter. They employ PFM voltage control circuits to achieve high efficiency, stable constant-voltage output.

FEATURES

- Power dissipation : 24 μ W at $V_{IN} = 1.5$ V, $V_{OUT} = 3.0$ V, $I_{OUT} = 100$ μ A
- Start-up input voltage : 0.9 V (max) at $R_L = 30$ k Ω
- Output voltage : 2.2 V to 3.3 V, available in 0.1 Vstep
- High efficiency : 85% at $V_{IN} = 1.5$ V, $V_{OUT} = 3.0$ V, $I_{OUT} = 1$ mA
- Low ripple voltage
- Package : SOT23-3, SOT89-3

APPLICATIONS

- PDA, Mobile IT equipment
- Digital Stil Camera
- Pager
- Constant-voltage sources for battery-operated equipment
- Local voltage sources

FUNCTIONAL DESCRIPTION

Step-up Principle

The SM6702 series use a transistor to switch the input supply in a non-isolated chopper switching regulator configuration. The figure below shows the basic step-up switching regulator circuit.

If the transistor is ON for an interval t_{ON} and then instantly turned OFF, the energy stored in the coil L during the interval t_{ON} generates a voltage V_L across the coil. This voltage is superimposed on the input voltage such that the peak voltage reaches $V_{IN} + V_L$ which forces the diode D to conduct and release the stored energy into the output.

During normal operation, the above switching occurs repeatedly at a frequency controlled by an oscillator (which can change depending on the input and output load conditions), generating a square wave output which is then smoothed by the output capacitor C . Thus the output voltage ($V_{OUT} > V_{IN}$) has been stepped up.

PFM Control

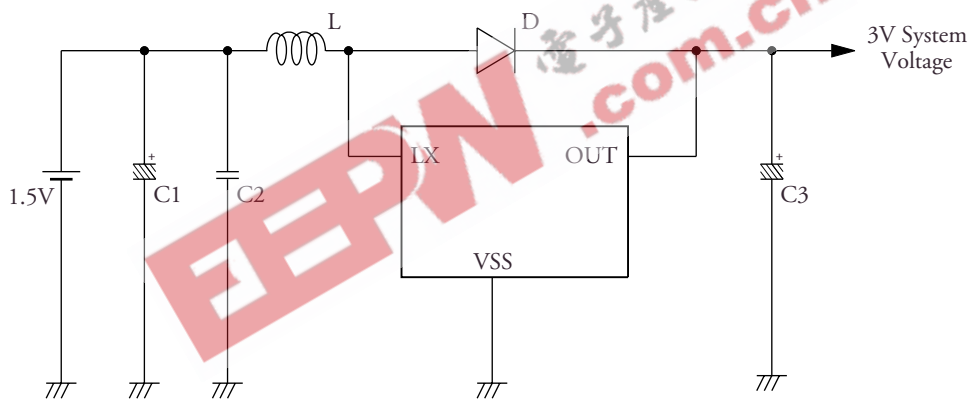

In SM6702 series, the LX transistor ON interval is fixed, and the OFF interval varies in response to the input voltage and load changes. Thus the resulting switching cycle frequency varies, called pulse frequency modulation.
