STK14EC8

512Kx8 Autostore nvSRAM

Preliminary

FEATURES

- **15, 25, 45 ns Read Access and R/W Cycle Time**
- **Unlimited Read/Write Endurance**
- **Automatic Non-volatile STORE on Power Loss**
- **Non-Volatile STORE Under Hardware or Software Control**
- **Automatic RECALL to SRAM on Power Up**
- **Unlimited RECALL Cycles**
- **200K STORE Endurance**
- **20-Year Non-volatile Data Retention**
- **Single 3.3V +0.3V, -0.6V Power Supply**
- **Commercial, Industrial Temperatures**
- **44-pin 400-mil TSOPII (RoHS-Compliant)**

DESCRIPTION

The Simtek STK14EC8 is a fast static RAM with a non-volatile Quantum Trap storage element included with each memory cell.

The SRAM provides the fast access & cycle times, ease of use and unlimited read & write endurance of a normal SRAM.

Data transfers automatically to the non-volatile storage cells when power loss is detected (the *STORE* operation). On power up, data is automatically restored to the SRAM (the *RECALL* operation). Both STORE and RECALL operations are also available under software control.

The Simtek nvSRAM is the highest performance, most reliable non-volatile memory available.

(See mechanical drawing on Page 18)

PIN DESCRIPTIONS

Pin Name	I/O	Description
A_{18}-A_0	Input	Address: The 19 address inputs select one of 524,288 bytes in the nvSRAM array
DQ_7-DQ_0	I/O	Data: Bi-directional 8-bit data bus for accessing the nvSRAM
$\overline{E}$	Input	Chip Enable: The active low $\overline{E}$ input selects the device
$\overline{W}$	Input	Write Enable: The active low $\overline{W}$ enables data on the DQ pins to be written to the address location latched by the falling edge of $\overline{E}$
$\overline{G}$	Input	Output Enable: The active low $\overline{G}$ input enables the data output buffers during read cycles. De-asserting $\overline{G}$ high caused the DQ pins to tri-state.
V_{CC}	Power Supply	Power: 3.0V, +20%, -10%
$\overline{HSB}$	I/O	$\overline{Hardware\ Store\ Busy}$: When low this output indicates a Store is in progress (also low during power up while busy). When pulled low external to the chip, it will initiate a nonvolatile STORE operation. A weak pull up resistor keeps this pin high if not connected. (Connection Optional).
V_{CAP}	Power Supply	Autostore Capacitor: Supplies power to the nvSRAM during a power loss to store data from SRAM to nonvolatile storage elements.
V_{SS}	Power Supply	Ground
NC	No Connect	This pin is not connected to the die. (Do not connect in design; reserved for future use)

ABSOLUTE MAXIMUM RATINGS[a]

Voltage on Input Relative to Ground . . . . . –0.5V to 4.1V
Voltage on Input Relative to V_{SS} . . . . . –0.5V to (V_{CC} + 0.5V)
Voltage on DQ_{0-7} or $\overline{HSB}$ . . . . . –0.5V to (V_{CC} + 0.5V)
Temperature under Bias. . . . . –55°C to 125°C
Junction Temperature . . . . . –55°C to 140°C
Storage Temperature . . . . . –65°C to 150°C
Power Dissipation 1W
DC Output Current (1 output at a time, 1s duration) 15mA

Note a: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Package Thermal Characteristics - See Website at http://www.simtek.com

DC CHARACTERISTICS

(V_{CC} = 2.7V-3.6V)

SYMBOL	PARAMETER	COMMERCIAL		INDUSTRIAL		UNITS	NOTES
		MIN	MAX	MIN	MAX		
I_{CC1}	Average V_{CC} Current		70 65 50		75 70 52	mA mA mA	t_{AVAV} = 15ns t_{AVAV} = 25ns t_{AVAV} = 45ns Dependent on output loading and cycle rate. Values obtained without output loads.

L	H	L	0x4E38 0xB1C7 0x83E0 0x7C1F 0x703F 0x4C63	Read SRAM Read SRAM Read SRAM Read SRAM Read SRAM Nonvolatile Recall	Output Data Output Data Output Data Output Data Output Data Output High Z	Active	q,r,s

Note q: The six consecutive addresses must be in the order listed. $\overline{W}$ must be high during all six consecutive cycles to enable a nonvolatile cycle.

Note r: While there are 19 addresses on the STK14EC8, only the lower 16 are used to control software modes

Note s: I/O state depends on the state of $\overline{G}$. The I/O table shown assumes $\overline{G}$ low

nvSRAM OPERATION

nvSRAM

The STK14EC8 nvSRAM is made up of two functional components paired in the same physical cell. These are the SRAM memory cell and a nonvolatile QuantumTrap cell. The SRAM memory cell operates like a standard fast static RAM. Data in the SRAM can be transferred to the nonvolatile cell (the STORE operation), or from the nonvolatile cell to SRAM (the RECALL operation). This unique architecture allows all cells to be stored and recalled in parallel. During the STORE and RECALL operations SRAM READ and WRITE operations are inhibited. The STK14EC8 supports unlimited read and writes like a typical SRAM. In addition, it provides unlimited RECALL operations from the nonvolatile cells and up to 200K STORE operations.

SRAM READ

The STK14EC8 performs a READ cycle whenever $\overline{E}$ and $\overline{G}$ are low while $\overline{W}$ and $\overline{HSB}$ are high. The address specified on pins A_{0-18} determine which of the 524,288 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t_{AVQV} (READ cycle #1). If the READ is initiated by $\overline{E}$ and $\overline{G}$, the outputs will be valid at t_{ELQV} or at t_{GLQV}, whichever is later (READ cycle #2). The data outputs will repeatedly respond to address changes within the t_{AVQV} access time without the need for transitions on any control input pins, and will remain valid until another address change or until $\overline{E}$ or $\overline{G}$ is brought high, or $\overline{W}$ and $\overline{HSB}$ is brought low.

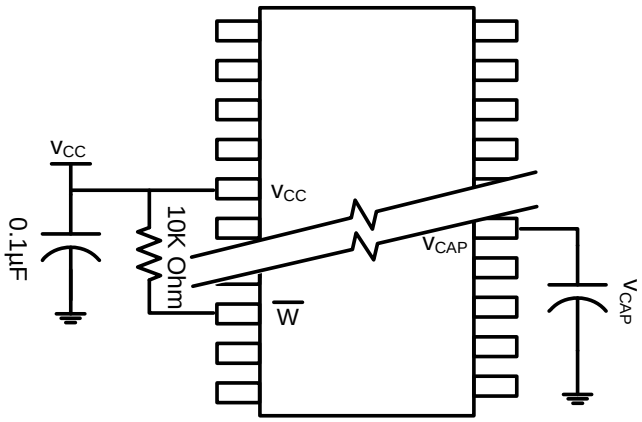

Figure 3: AutoStore Mode

SRAM WRITE

A WRITE cycle is performed whenever $\overline{E}$ and $\overline{W}$ are low and $\overline{HSB}$ is high. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either $\overline{E}$ or $\overline{W}$ goes high at the end of the cycle. The data on the common I/O pins DQ0-7 will be written into memory if it is valid t_{DVWH} before the end of a $\overline{W}$ controlled WRITE or t_{DVEH} before the end of an $\overline{E}$ controlled WRITE.

It is recommended that $\overline{G}$ be kept high during the entire WRITE cycle to avoid data bus contention on common I/O lines. If $\overline{G}$ is left low, internal circuitry will turn off the output buffers t_{WLQZ} after $\overline{W}$ goes low.

AutoStore OPERATION

The STK14EC8 stores data to nvSRAM using one of three storage operations. These three operations are Hardware Store (activated by HSB), Software Store (activated by an address sequence), and AutoStore (on power down).

AutoStore operation is a unique feature of Simtek QuanumTrap technology that is enabled by default on the STK14EC8.

During normal operation, the device will draw current from V_{CC} to charge a capacitor connected to the V_{CAP} pin. This stored charge will be used by the chip to perform a single STORE operation. If the voltage on the V_{CC} pin drops below V_{SWITCH}, the part will automatically disconnect the V_{CAP} pin from V_{CC}. A STORE operation will be initiated with power provided by the V_{CAP} capacitor.

Figure 3 shows the proper connection of the storage capacitor (V_{CAP}) for automatic store operation. Refer to the DC CHARACTERISTICS table for the size of V_{CAP}. The voltage on the V_{CAP} pin is driven to 5V by a charge pump internal to the chip. A pull up should be placed on $\overline{W}$ to hold it inactive during power up. This pull-up is only effective if the $\overline{W}$ signal is tri-state during power up. Many MPU's will tri-state their controls on power up. This should be verified when using the pullup. When the nvSRAM comes out on power-on-recall, the MPU must be active or the $\overline{W}$ held inactive until the MPU comes out of reset.

To reduce unneeded nonvolatile stores, AutoStore and Hardware Store operations will be ignored unless at least one WRITE operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a WRITE operation has taken place. The HSB signal can be monitored by the system to detect an AutoStore cycle is in progress.

HARDWARE STORE (HSB) OPERATION

The STK14EC8 provides the HSB pin for controlling and acknowledging the STORE operations. The HSB pin can be used to request a hardware STORE cycle. When the HSB pin is driven low, the STK14EC8 will conditionally initiate a STORE operation after t_{DELAY}. An actual STORE cycle will only begin if a WRITE to the SRAM took place since the last STORE or RECALL cycle. The HSB pin also acts as an open drain driver that is internally driven low to indicate a busy condition while the STORE (initiated by any means) is in progress. This pin should be externally pulled up if it is used to drive other inputs.

SRAM READ and WRITE operations that are in progress when HSB is driven low by any means are given time to complete before the STORE operation is initiated. After HSB goes low, the STK14CA8 will continue to allow SRAM operations for t_{DELAY}. During t_{DELAY}, multiple SRAM READ operations may take place. If a WRITE is in progress when HSB is pulled low, it will be allowed a time, t_{DELAY}, to complete. However, any SRAM WRITE cycles requested after HSB goes low will be inhibited until HSB returns high.

If HSB is not used, it should be left unconnected.

HARDWARE RECALL (POWER-UP)

During power up or after any low-power condition (V_{CC}<V_{SWITCH}), an internal RECALL request will be latched. When V_{CC} once again exceeds the sense voltage of V_{SWITCH}, a RECALL cycle will automatically be initiated and will take $t_{HRECALL}$ to complete.

SOFTWARE STORE

Data can be transferred from the SRAM to the nonvolatile memory by a software address sequence. The STK14EC8 software STORE cycle is initiated by executing sequential E controlled or G controlled READ cycles from six specific address locations in exact order. During the STORE cycle, previous data is erased and then the new data is programmed into the nonvolatile elements. Once a STORE cycle is initiated, further memory inputs and outputs are disabled until the cycle is completed.

To initiate the software STORE cycle, the following READ sequence must be performed:

1	Read Address	0x4E38	Valid READ
2	Read Address	0xB1C7	Valid READ
3	Read Address	0x83E0	Valid READ
4	Read Address	0x7C1F	Valid READ
5	Read Address	0x703F	Valid READ
6	Read Address	0x8FC0	Initiate STORE Cycle

Once the sixth address in the sequence has been entered, the STORE cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles be used in the sequence and that G is active. After the t_{STORE} cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

SOFTWARE RECALL

Data can be transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of READ operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of E controlled or G controlled READ operations must be performed:

1	Read Address	0x4E38	Valid READ
2	Read Address	0xB1C7	Valid READ
3	Read Address	0x83E0	Valid READ
4	Read Address	0x7C1F	Valid READ
5	Read Address	0x703F	Valid READ
6	Read Address	0x4C63	Initiate RECALL Cycle

Internally, RECALL is a two-step procedure. First, the SRAM data is cleared, and second, the nonvolatile information is transferred into the SRAM cells. After the t_{RECALL} cycle time, the SRAM will once again be ready for READ or WRITE operations. The RECALL operation in no way alters the data in the nonvolatile storage elements. Care must be taken so the controlling falling edge is glitch and ring free so as not to double clock the read address.

DATA PROTECTION

The STK14EC8 protects data from corruption during low-voltage conditions by inhibiting all externally initiated STORE and WRITE operations. The low-voltage condition is detected when V_{CC}<V_{SWITCH}.

If the STK14CA8 is in a WRITE mode (both $\overline{E}$ and $\overline{W}$ low) at power-up, after a RECALL, or after a STORE, the WRITE will be inhibited until a negative transition on $\overline{E}$ or $\overline{W}$ is detected. This protects against inadvertent writes during power up or brown out conditions.

NOISE CONSIDERATIONS

The STK14EC8 is a high-speed memory and so must have a high-frequency bypass capacitor of approximately 0.1 µF connected between V_{CC} and V_{SS}, using leads and traces that are a short as possible. As with all high-speed CMOS ICs, careful routing of power, ground, and signals will reduce circuit noise.

LOW AVERAGE ACTIVE POWER

CMOS technology provides the STK14EC8 with the benefit of power supply current that scales with cycle time. Less current will be drawn as the memory cycle time becomes longer than 50 ns. Figure 4 shows the relationship between I_{CC} and READ/WRITE cycle time. Worst-case current consumption is shown for commercial temperature range, V_{CC}=3.6V, and chip enable at maximum frequency. Only standby current is drawn when the chip is disabled. The overall average current drawn by the STK14EC8 depends on the following items:

1. The duty cycle of chip enable
2. The overall cycle rate for operations
3. The ratio of READs to WRITEs
4. The operating temperature
5. The V_{CC} Level
6. I/O Loading

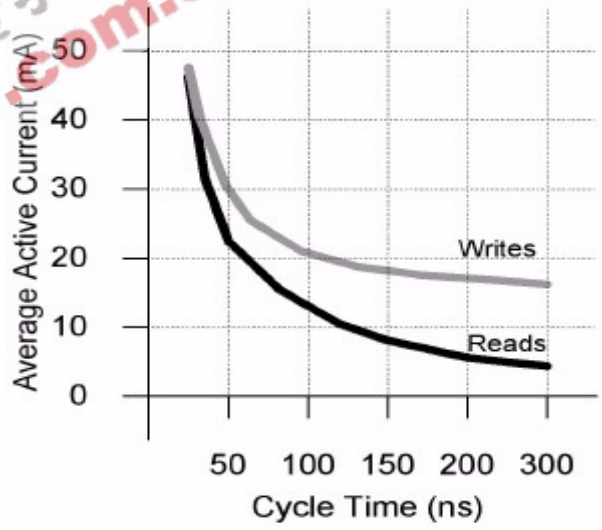

Figure 4 - Current vs Cycle Time

Preliminary

PREVENTING AUTOSTORE

The AutoStore function can be disabled by initiating an *AutoStore Disable* sequence. A sequence of READ operations is performed in a manner similar to the software STORE initiation. To initiate the *AutoStore Disable* sequence, the following sequence of $\overline{E}$ controlled or $\overline{G}$ controlled READ operations must be performed:

1	Read Address	0x4E38	Valid READ
2	Read Address	0xB1C7	Valid READ
3	Read Address	0x83E0	Valid READ
4	Read Address	0x7C1F	Valid READ
5	Read Address	0x703F	Valid READ
6	Read Address	0x8B45	AutoStore Disable

The AutoStore can be re-enabled by initiating an *AutoStore Enable* sequence. A sequence of READ operations is performed in a manner similar to the software RECALL initiation. To initiate the *AutoStore Enable* sequence, the following sequence of $\overline{E}$ controlled or $\overline{G}$ controlled READ operations must be performed:

1	Read Address	0x4E38	Valid READ
2	Read Address	0xB1C7	Valid READ
3	Read Address	0x83E0	Valid READ
4	Read Address	0x7C1F	Valid READ
5	Read Address	0x703F	Valid READ
6	Read Address	0x4B46	AutoStore Enable

If the AutoStore function is disabled or re-enabled, a manual STORE operation (Hardware or Software) needs to be issued to save the AutoStore state through subsequent power down cycles. The part comes from the factory with AutoStore enabled, but best design practice is to set the enable or disable state during each power-up sequence and not depend on this factory default condition. Simtek recommends users configure the part completely for the specific application.

ORDERING INFORMATION

STK14EC8-T F 45 I TR

Packing Option
