

SRAM

512K X 16 LOW POWER CMOS STATIC RAM

FEATURES

- Low-power consumption
 - Active: 5mA (I_{CC1})
 - Stand-by: 2uA (CMOS input/output)
- 55/70/100 ns access time
- Equal access and cycle time
- Single +2.7V to 3.6V Power Supply
- TTL compatible , Tri-state output
- Common I/O capability
- Automatic power-down when deselected
- Available in 44-PIN TSOP-II and 48-pin CSP packages

GENERAL DESCRIPTION

The T15V8M16A is a very Low Power CMOS Static RAM organized as 524,288 words by 16 bits. That operates on a wide voltage range from 2.7V to 3.6V power supply, Fabricated using high performance CMOS technology, Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures. Data retention is guaranteed at a power supply voltage as low as 2V.

TIMING WAVEFORMS

READ CYCLE 1

(Address Controlled, $\overline{CE} = \overline{OE} = V_{IL}$, $\overline{WE} = V_{IH}$, \overline{LB} or/and $\overline{UB} = V_{IL}$)

READ CYCLE 2 ($\overline{WE} = V_{IH}$)

 DON'T CARE
 UNDEFINED

(Chip Enable Controlled)

Notes (READ CYCLE) :

1. \overline{WE} are high for read cycle.
2. All read cycle timing is referenced from the last valid address to the first transition address.
3. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit condition referenced to V_{OH} or V_{OL} levels.
4. At any given temperature and voltage condition. t_{HZ} (max.) is less than t_{LZ} (min.) both for a given device and from device to device interconnection.
5. Transition is measured $\pm 200\text{mV}$ from steady state voltage with load. This parameter is sampled and not 100% tested.
6. Device is continuously selected with $\overline{CE} = V_{IL}$.

WRITE CYCLE 1 (\overline{WE} Controlled)

WRITE CYCLE 2 (\overline{CE} Controlled)

WRITE CYCLE 3 (UB, LB Controlled)

NOTES (WRITE CYCLE) :

1. A write occurs during the overlap of a low \overline{CE} , a low \overline{WE} . A write begins at the latest transition among \overline{CE} goes low, \overline{WE} going low. A write ends at the earliest transition among \overline{CE} going high, \overline{WE} going high. t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of \overline{CE} going low to the end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the end of write to the address change.
