

## VOLTAGE DETECTOR

### FEATURES

- Precise Detection Thresholds .... Standard  $\pm 2.0\%$   
Custom  $\pm 1.0\%$
- Small Packages ..... SOT-23A-3, SOT-89, TO-92
- Low Current Drain ..... Typ.  $1\mu\text{A}$
- Wide Detection Range ..... 2.1V to 6.0V
- Wide Operating Voltage Range ..... 1.5V to 10V

### APPLICATIONS

- Battery Voltage Monitoring
- Microprocessor Reset
- System Brownout Protection
- Switching Circuit in Battery Backup
- Level Discriminator

### GENERAL DESCRIPTION

The TC54 Series are CMOS voltage detectors, suited especially for battery-powered applications because of their extremely low  $1\mu\text{A}$  operating current and small surface-mount packaging. Each part is laser trimmed to the desired threshold voltage which can be specified from 2.1V to 6.0V, in 0.1V steps.

The device includes a comparator, low-current high-precision reference, laser-trimmed divider, hysteresis circuit and output driver. The TC54 is available with either an open-drain or complementary output stage.

In operation, the TC54's output ( $V_{OUT}$ ) remains in the logic HIGH state as long as  $V_{IN}$  is greater than the specified threshold voltage ( $V_{DET}$ ). When  $V_{IN}$  falls below  $V_{DET}$ , the output is driven to a logic LOW.  $V_{OUT}$  remains LOW until  $V_{IN}$  rises above  $V_{DET}$  by an amount  $V_{HYST}$ , whereupon it resets to a logic HIGH.

## TIMING CHART

## DESCRIPTION OF OPERATION

Refer to the Timing Chart below. In normal steady-state operation, when  $V_{IN} > V_{DET}^-$ , the output will be at a logic high. In the case of the TC54V, this is an open-drain condition. If and when the input falls below  $V_{DET}^-$ , the output will pull down (Logic 0) to  $V_{SS}$ . Generally,  $V_{OUT}$  can pull down to within 0.5V of  $V_{SS}$  at rated output current and input voltage. (See the Electrical Characteristics section).

The output,  $V_{OUT}$ , will stay valid until the input voltage falls below the Minimum Operating Voltage,  $V_{IN(MIN)}$ , of 1.5V. Below this minimum operating voltage, the output is undefined. During power-up or anytime  $V_{IN}$  has fallen below  $V_{IN(MIN)}$ ,  $V_{OUT}$  will remain undefined until  $V_{IN}$  rises above  $V_{IN(MIN)}$ , at which time the output will become valid.  $V_{OUT}$  will be in its active low state while  $V_{IN(MIN)} < V_{IN} < V_{DET}^+$ . ( $V_{DET}^+ = V_{DET}^- + V_{HYST}$ ). If and when the input rises above  $V_{DET}^+$ , the output will assume its inactive state. (High for TC54VC, open-drain for TC54VN).
