

## COLOR TV SCANNING AND POWER SUPPLY PROCESSOR

### DEFLECTION

- CERAMIC 500kHz RESONATOR FREQUENCY REFERENCE
- NO LINE AND FRAME OSCILLATOR ADJUSTMENT REFERENCE
- DUAL PLL FOR LINE DEFLECTION
- HIGH PERFORMANCE SYNCHRONIZATION
- SUPER SANDCASTLE OUTPUT
- FRAME BLANKING WITH SAFETY CIRCUIT
- VIDEO IDENTIFICATION CIRCUIT
- AUTOMATIC 50/60Hz STANDARD IDENTIFICATION
- EXCELLENT INTERLACING CONTROL
- SPECIAL PATENTED FRAME SYNCHRO DEVICE FOR VCR OPERATION
- FRAME SAW-TOOTH GENERATOR

### SMPS CONTROL

- ERROR AMPLIFIER AND PHASE MODULATOR
- SYNCHRONIZATION WITH HORIZONTAL DEFLECTION
- SECURITY CIRCUIT AND START-UP PROCESSOR
- OUTPUT PULSES ARE SENT TO THE PRIMARY SMPS IC TEA2261 THROUGH A LOW COST SYNCHRO PULSE TRANSFORMER

### DESCRIPTION

The TEA2028B is a complete (horizontal and vertical) deflection processor with secondary to primary SMPS control for color TV sets.

### PIN CONNECTIONS

LINE MONOSTABLE CAPACITOR	1	28	SAFETY INPUT
SAFETY FRAME BLANKING INPUT	2	27	VIDEO INPUT
FRAME SAW-TOOTH OUTPUT	3	26	H. SYNCHRO CAPACITOR (tip level)
FRAME BLANKING OUTPUT	4	25	VIDEO IDENTIFICATION CAPACITOR
FRAME RAMP GENERATOR	5	24	MUTING + 50/60Hz IDENT. OUTPUT
GROUND POWER	6	23	V.C.R. INPUT
SWITCH MODE POWER SUPPLY OUTPUT	7	22	PHASE COMPARATOR $\phi$ 1 CAPACITOR
$V_{CC}$	8	21	GROUND SUBSTRAT
S.M.P.S. INPUT REGULATION	9	20	FRAME SYNCHRO ADJUSTMENT CAPACITOR
HORIZONTAL OUTPUT	10	19	V.C.O. INPUT
S. SANDCASTLE OUTPUT	11	18	V.C.O. OUTPUT
HORIZONTAL FLYBACK INPUT	12	17	V.C.O. 90° REF.
HORIZONTAL SAW-TOOTH	13	16	PHASE COMPARATOR $\phi$ 2 CAPACITOR
CURRENT REFERENCE	14	15	STARTING AND SAFETY CAPACITOR

## GENERAL DESCRIPTION

### Introduction

This integrated circuit uses  $I^2L$  bipolar technology and combines analog signal processing with digital processing.

Timing signals are obtained from a voltage-controlled oscillator (VCO) operating at 500kHz by means of a cheap ceramic resonator. This avoids the frequency adjustment normally required with line and frame oscillators.

A chain of dividers and appropriate logic circuitry produce very accurately defined sampling pulses and the necessary timing signals.

The principal functions implemented are :

- Horizontal scanning processor.
- Frame scanning processor :  
B Class Power stage using an external power amplifier with fly back generator such as the TDA8170.
- Secondary switch mode power regulation.
- The SMPS output synchronize a primary I.C. TEA2261 at the mains part.
- This concept allows ACTIVE STANDBY facilities.
- Line and frame synchronization separation.
- Dual phase-locked loop horizontal scanning.
- High performance frame and line synchronization with interlacing control.
- Video identification circuit.
- Super sandcastle.
- Automatic 50-60Hz standard identification.
- VCR input for PLL time constant and frame synchro switching.
- Frame saw-tooth generator.
- Frame blanking output.
- Switching mode regulated power supply comprising error amplifier and phase modulator.
- Security circuit and start-up processor.
- 500kHz VCO.

The circuit is supplied in a 28 pin DIP case.

$V_{CC} = 12V$ .

### Synchronization Separator

Line synchronization separator is clamped to black level of input video signal with synchronization pulse bottom level measurement.

The synchronization pulses are divided centrally between the black level and the synchronization pulse bottom level, to improve performance on video signals in noise conditions.

### Frame Synchronization

Time constant of Frame Separator can be adjusted by adding a capacitor pin 20.

The frame timing identification logic permits automatic adaptation to 50 - 60Hz standards or non-interlaced video.

An automatic synchronization window width sys-

tem provides :

- fast frame capture (6.7ms wide window),
- good noise immunity (0.4ms narrow window).

The internal generator starts the discharge of the saw-tooth generator capacitor so that it is not disturbed by line fly-back effects.

Thanks to the logic control, the beginning of the charge phase does not depend on any disturbing effect of the line fly-back.

A 32 $\mu$ s timing is automatically applied on standardized transmissions, for perfect interlacing.

In VCR mode, the discharge time is controlled by an internal monostable independent of the line frequency and gives a direct frame synchronization.

### Horizontal Scanning

The horizontal scanning frequency is obtained from the 500kHz VCO.

The circuit uses two phase-locked loops (PLL) : the first one controls the frequency, the second one controls the relative phase of the synchronization and line fly-back signals.

The frequency PLL has two switched time constants to provide :

- capture with a short time constant,
- good noise immunity after capture with a long time constant.

The output pulse has a constant duration of 29 $\mu$ s (with  $C(\text{pin } 1) = 3.3nF$ ), independent of  $V_{CC}$  and delay in switching off the scanning transistor.

### Video Identification

The horizontal synchronization signal is sampled by a 2 $\mu$ s pulse within the synchronization pulse. The signal is integrated by an external capacitor. The identification function provides three different levels :

- 0V : no video identification
- 6V : 60Hz video identification
- 12V : 50Hz video identification

This information may be used for timing research in the case of frequency or voltage synthesizer type receivers and for audio muting.

**Super Sandcastle** with 3 levels : burst, line fly-back, frame blanking

In the event of vertical scanning failure, the frame blanking level goes high to protect the tube.

Frame blanking time (start with reset of frame divider) is 21 lines.

### VCR Input

This provides for continuous use of the short time constant of the first phase-locked loop (frequency). In VCR mode, the frame synchronization window widens out to a search window and there is no delay of frame fly-back (direct synchronization).

**Frame Saw-tooth Generator**

The current to charge the capacitor is automatically switched to 60Hz operation to maintain constant amplitude.

**Switch Mode Power Supply (S.M.P.S) Secondary to Primary Regulation**

This power supply uses a differential error amplifier with an internal reference voltage of 1.26V and a phase modulator operating at the line frequency. The power transistor is turned off by the falling edge of the horizontal saw-tooth.

The "soft start" device imposes a very small conduction angle on starting up, this angle progressively increases to its nominal regulation value. The maximum conduction angle may be monitored by forcing a voltage on pin 15. This pin may also be used for current limitation.

The output pulse is sent to the primary I.C. TEA2261 via a low cost synchro transformer.

**Security Circuit And Start-up Processor**

When the security input (pin 28) is at a voltage below 1.26V the two outputs are simultaneously cut off until this voltage reaches the 1.26V threshold again. In this case the switch mode power supply is restarted by the "soft start" system.

If this cycle is repeated three times, the two outputs are cut off definitively. To reset the safety logic circuits, V<sub>CC</sub> must be lower than 3.5V.

This circuit eliminates the risk to switch off the TV receiver in the event of a flash affecting the tube. On starting up the horizontal scanning function comes into operation at V<sub>CC</sub> = 6V. The power supply then comes into operation progressively. On shutting down, the two functions are interrupted simultaneously after the first line fly back.

**Frame Blanking Safety (Pin 2)**

The frame blanking safety checks the normal of frame scanning.

In case of any problem pin 4 and pin 11 is at a high level (frame blanking) in order to protect the tube.

**ABSOLUTE MAXIMUM RATINGS (limiting values) (T<sub>amb</sub> = 25°C unless otherwise noted)**

Symbol	Parameter	Min.	Max.	Unit
	Supply Voltage (pin 8)		14	V
