## TDA4420

Figure 3 : Application Circuit.

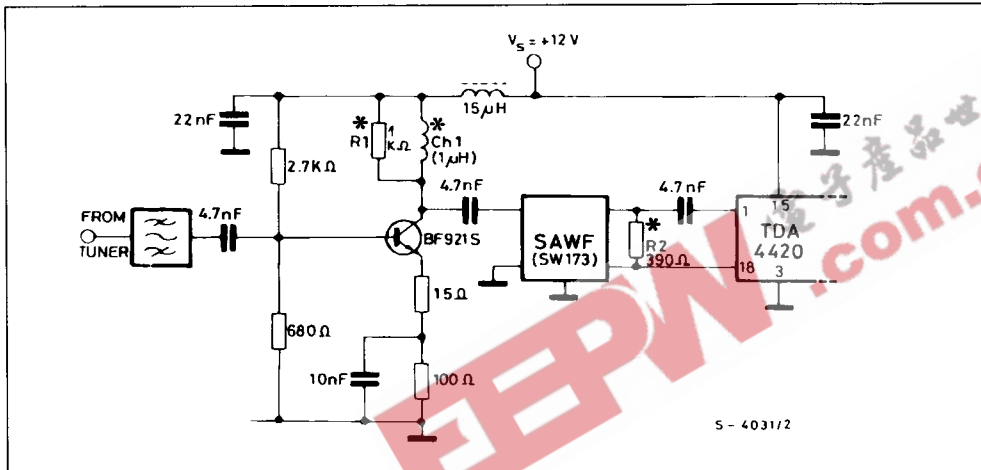

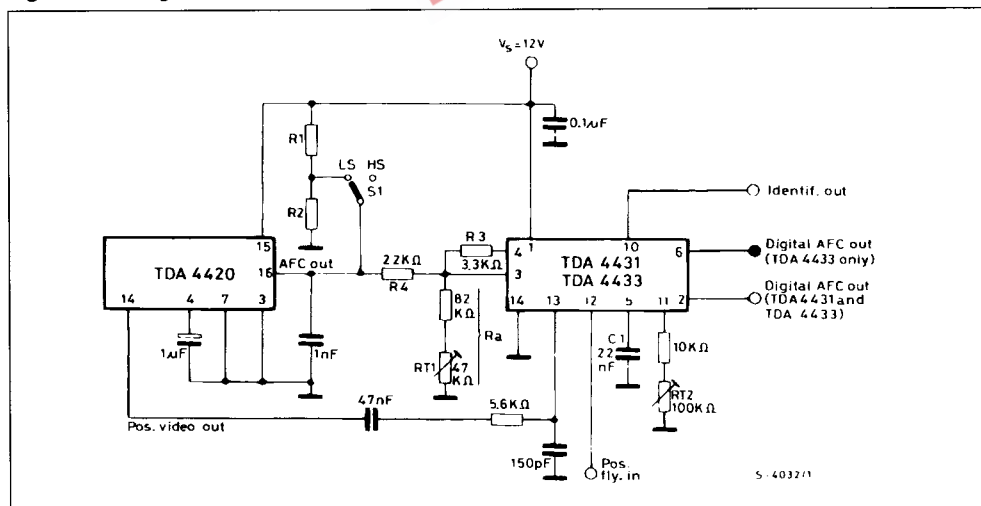

Figure 4 : TV Signal Identification Circuit.

### TV signal identification circuit :

The suggested application circuit is shown in fig. 4.

The passive components are chosen as follows :

**R<sub>1</sub> and R<sub>2</sub> :** these define the AFC response slope.  
For R<sub>1</sub> = R<sub>2</sub> = 5.1 KΩ, the typical slope is 750/11 KHz/V (with AFC output unloaded).

**S<sub>1</sub> :** switches between low slope (LS) and high slope (HS). The high slope is typically 88/11 KHz/V.

**R<sub>3</sub> and R<sub>4</sub> :** the ratio  $(R_3 + R_4)/R_3$  defines the digital AFC width ( $\delta f$ ) calculated from the linear AFC width ( $2\Delta f$ ). With  $V_s = 12$  V, the relation is :

$$\delta f = 0.036 \frac{(R_3 + R_4)}{R_3} (\Delta f)$$

## TDA4420

**RT1 :** by means of this trimmer it is possible to align the linear tuning with the digital one, at the same frequency. The typical relation is :

$$R_a = 33 R_3$$

with  $R_3 = 3.3 \text{ K}\Omega$ ,  $R_a$  can be a fixed resistor of  $110 \text{ K}\Omega$ .

To make better sensitivity adjustment of trimmer  $RT_2$ , it is necessary to use only a weak signal at the

antenna. The video information must be a black picture or a field of small white points on a black field. Furthermore, the action of the syncs separator must be as quick as possible.

In receivers with automatic program search,  $S_1$  should be in the HS position and then the components  $S_1$ ,  $R_1$  and  $R_2$  can be omitted completely.
