

# Regulating Pulse Width Modulators

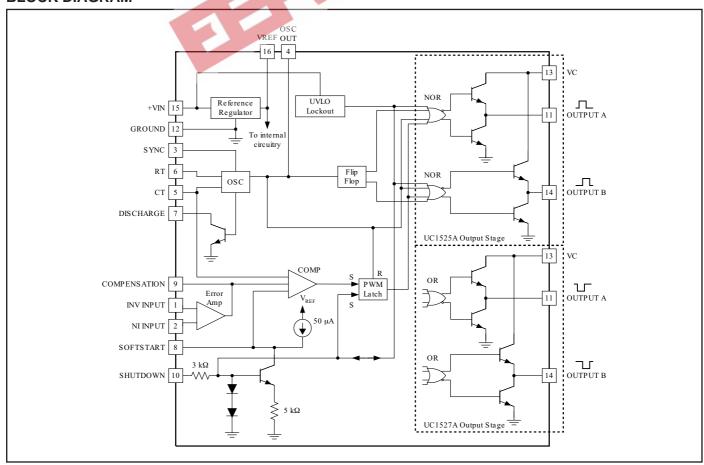

### **FEATURES**

- 8 to 35V Operation
- 5.1V Reference Trimmed to ±1%
- 100Hz to 500kHz Oscillator Range
- Separate Oscillator Sync Terminal
- Adjustable Deadtime Control
- Internal Soft-Start
- Pulse-by-Pulse Shutdown
- Input Undervoltage Lockout with Hysteresis
- Latching PWM to Prevent Multiple Pulses
- Dual Source/Sink Output Drivers

### **DESCRIPTION**

The UC1525A/1527A series of pulse width modulator integrated circuits are designed to offer improved performance and lowered external parts count when used in designing all types of switching power supplies. The on-chip +5.1V reference is trimmed to ±1% and the input common-mode range of the error amplifier includes the reference voltage, eliminating external resistors. A sync input to the oscillator allows multiple units to be slaved or a single unit to be synchronized to an external system clock. A single resistor between the C<sub>T</sub> and the discharge terminals provides a wide range of dead-time adjustment. These devices also feature built-in soft-start circuitry with only an external timing capacitor required. A shutdown terminal controls both the soft-start circuitry and the output stages, providing instantaneous turn off through the PWM latch with pulsed shutdown, as well as soft-start recycle with longer shutdown commands. These functions are also controlled by an undervoltage lockout which keeps the outputs off and the soft-start capacitor discharged for sub-normal input voltages. This lockout circuitry includes approximately 500mV of hysteresis for jitter-free operation. Another feature of these PWM circuits is a latch following the comparator. Once a PWM pulse has been terminated for any reason, the outputs will remain off for the duration of the period. The latch is reset with each clock pulse. The output stages are totem-pole designs capable of sourcing or sinking in excess of 200mA. The UC1525A output stage features NOR logic, giving a LOW output for an OFF state. The UC1527A utilizes OR logic which results in a HIGH output level when OFF.

### **BLOCK DIAGRAM**

## ABSOLUTE MAXIMUM RATINGS(Note 1)

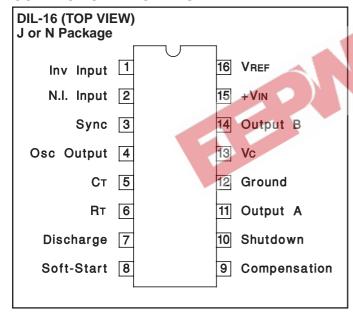

Supply Voltage, (+V <sub>IN</sub> )+40V
Collector Supply Voltage (V <sub>C</sub> ) +40V
Logic Inputs
Analog Inputs
Output Current, Source or Sink 500mA
Reference Output Current50mA
Oscillator Charging Current 5mA
Power Dissipation at $T_A = +25$ °C (Note 2) 1000mW
Power Dissipation at $T_C = +25^{\circ}C$ (Note 2) 2000mW
Operating Junction Temperature –55°C to +150°C
Storage Temperature Range65°C to +150°C
Lead Temperature (Soldering, 10 seconds)+300°C
Note 1: Values beyond which damage may occur.
Note 2: Consult packaging Section of Databook for thermal
limitations and considerations of package.

# **RECOMMENDED OPERATING CONDITIONS** (Note 3)

Input Voltage (+V <sub>IN</sub> )+8V to +35V
Collector Supply Voltage (V <sub>C</sub> )+4.5V to +35V
Sink/Source Load Current (steady state) 0 to 100mA
Sink/Source Load Current (peak) 0 to 400mA
Reference Load Current 0 to 20mA
Oscillator Frequency Range100Hz to 400kHz
Oscillator Timing Resistor $2k\Omega$ to $150k\Omega$
Oscillator Timing Capacitor
Dead Time Resistor Range 0 to $500\Omega$
Operating Ambient Temperature Range
UC1525A, UC1527A55°C to +125°C
UC2525A, UC2527A–25°C to +85°C
UC3525A, UC3527A0°C to +70°C

Output High Level		3.8	5.6		3.8	5.6		V
Common Mode Rejection	V <sub>CM</sub> = 1.5 to 5.2V	60	75		60	75		dB
Supply Voltage Rejection	V <sub>IN</sub> = 8 to 35V	50	60		50	60		dB

Note 5: These parameters, although ensured over the recommended operating conditions, are not 100% tested in production.

Note 6: Tested at  $f_{OSC}$  = 40kHz (R<sub>T</sub> = 3.6k $\Omega$ , C<sub>T</sub> = 0.01 $\mu$ F, R<sub>D</sub> = 0 $\Omega$ ). Approximate oscillator frequency is defined by:

$$f = \frac{1}{C_T \left( 0.7R_T + 3R_D \right)}$$

Note 7: DC transconductance  $(g_M)$  relates to DC open-loop voltage gain  $(A_V)$  according to the following equation:  $A_V = g_M R_L$  where  $R_L$  is the resistance from pin 9 to ground. The minimum  $g_M$  specification is used to calculate minimum  $A_V$  when the error amplifier output is loaded.

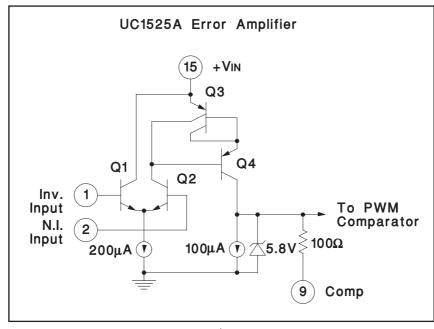

**ELECTRICAL CHARACTERISTICS:**+V<sub>IN</sub> = 20V, and over operating temperature, unless otherwise specified, T<sub>A</sub> = T<sub>J</sub>.

Note 7: Collector off-state quiescent current measured at pin 13 with outputs low for UC1525A and high for UC1527A.

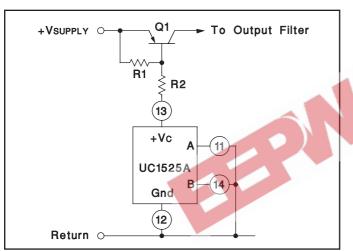

### PRINCIPLES OF OPERATION AND TYPICAL CHARACTERISTICS

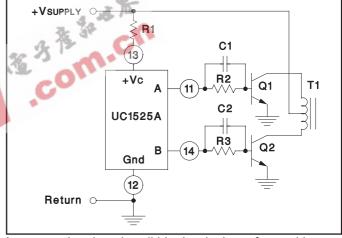

UC1525A output circuit (1/2 circuit shown).

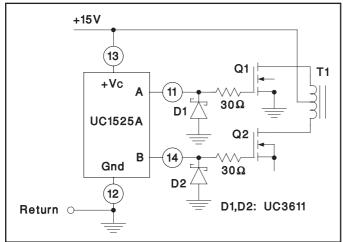

UC1525A output saturation characteristics.

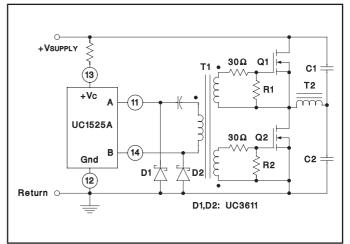

For single-ended supplies, the driver outputs are grounded. The  $V_{\text{C}}$  terminal is switched to ground by the totem-pole source transistors on alternate oscillator cycles.

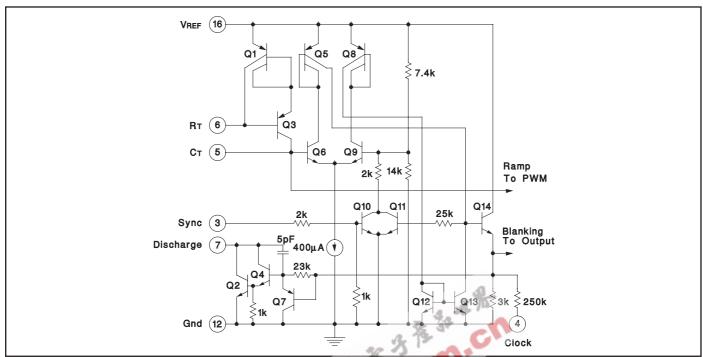

In conventional push-pull bipolar designs, forward base drive is controlled by R1-R3. Rapid turn-off times for the power devices are achieved with speed-up capacitors C1 and C2.

The low source impedance of the output drivers provides rapid charging of power FET Input capacitance while minimizing external components.

Low power transformers can be driven by the UC1525A. Automatic reset occurs during dead time, when both ends of the primary winding are switched to ground.

UC1525A oscillator schematic.

# PRINCIPLES OF OPERATION AND TYPICAL CHARACTERISTIC SHUTDOWN OPTIONS

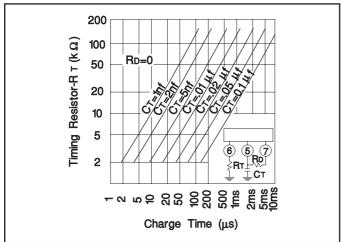

(See Block Diagram)

Since both the compensation and soft-start terminals (Pins 9 and 8) have current source pull-ups, either can readily accept a pull-down signal which only has to sink a maximum of  $100\mu A$  to turn off the outputs. This is subject to the added requirement of discharging whatever external capacitance may be attached to these pins.

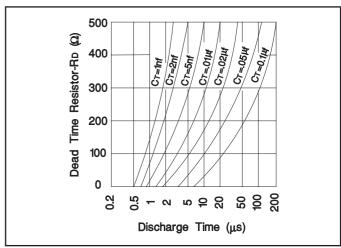

An alternate approach is the use of the shutdown circuitry of Pin 10 which has been improved to enhance the available shutdown options. Activating this circuit by applying a positive signal on Pin 10 performs two functions; the PWM latch is immediately set providing the fastest

turn-off signal to the outputs; and a  $150\mu\text{A}$ -current sink begins to discharge the external soft-start capacitor. If the shutdown command is short, the PWM signal is terminated without significant discharge of the soft-start capacitor, thus, allowing, for example, a convenient implementation of pulse-by-pulse current limiting. Holding Pin 10 high for a longer duration, however, will ultimately discharge this external capacitor, recycling slow turn-on upon release.

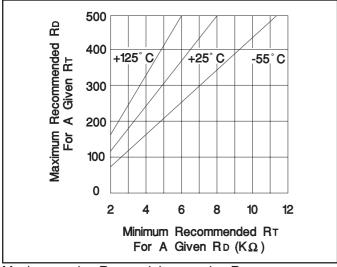

Pin 10 should not be left floating as noise pickup could conceivably interrupt normal operation. All transitions of the voltage on pin 10 should be within the time frame of one clock cycle and not repeated at a frequency higher than 10 clock cycles.

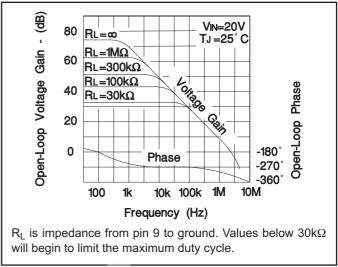

Oscillator Charge Time vs R<sub>T</sub> and C<sub>T</sub>.

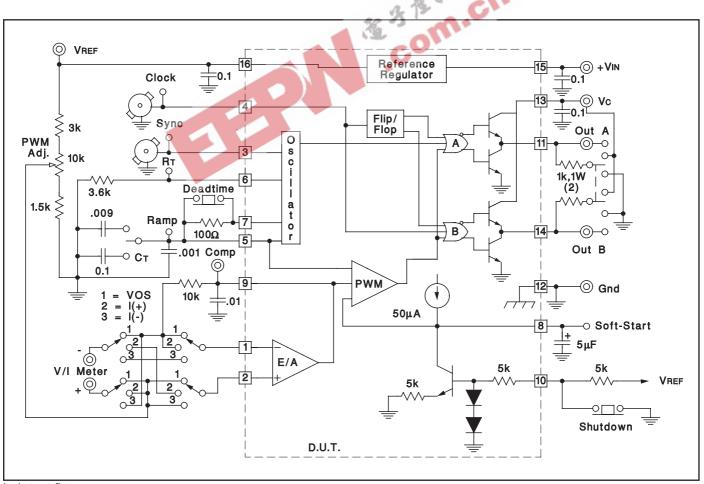

Oscillator Discharge Time vs R<sub>D</sub> and C<sub>T</sub>.

Maximum value R<sub>D</sub> vs minimum value R<sub>T</sub>.

Error amplifier voltage gain and phase vs frequency.
