Rev B1, Page 1/7

### FEATURES

- ◆ Monolithic array of independent photodiodes with excellent matching
- ◆ Compact photodiode size of  $800\ \mu\text{m} \times 330\ \mu\text{m}$  enabling smaller encoder systems
- ◆ Moderate alignment tolerance due to a track pitch of 1.08 mm
- ◆ Ultra low dark currents for operation to high temperature
- ◆ Low noise amplifiers with high transimpedance of typ.  $4\ \text{M}\Omega$
- ◆ Short-circuit-proof, low impedance voltage outputs for enhanced EMI tolerance
- ◆ Low power consumption from single 5 V supply
- ◆ Operational temperature range of  $-40$  to  $125\ ^\circ\text{C}$
- ◆ Space saving 15-pin optoBGA package (RoHS compatible)
- ◆ Available options
  - reticle assembly, code discs
  - customized COB modules

### APPLICATIONS

- ◆ Optical position encoding from analog sine/cosine signals
- ◆ Incremental encoders with interpolation
- ◆ Absolute position encoders using nonius scales

### DESCRIPTION

The iC-LSHC photodiode is a general purpose optoelectronic scanner made to suit a variety of encoding applications, such as rotary and linear encoders used for motion control, robotics, brushless DC motor commutation, power tools etc.

iC-LSHC features 12 monolithically integrated photodiodes with active areas of 800  $\mu\text{m}$  x 330  $\mu\text{m}$  each. A high transimpedance gain of typically 4 M $\Omega$  generates output signals of a few hundred Millivolts already from illumination levels of 0.3 to 0.7 mW/cm<sup>2</sup>. In most cases no additional measures must be considered to filter for noise and interferences.

Sine/cosine encoders are the typical application for iC-LSHC. Its 3-track scanning features a set of 4 pho-

tosensors each per track, generating positive and negative going sine signals, as well as positive and negative going cosine signals. An excellent matching and common mode behavior of the differential signal paths is obtained by a paired amplifier design, reducing the needs for external signal calibration to an absolute minimum.

The spectral sensitivity range includes visible to near infrared light, with the maximum sensitivity being close to a wavelength of 680 nm. When using iC-LSHC for encoder applications with typical disc and mask codes, a signal amplitude of approximately 1 V is typical under low light conditions, for instance when iC-LSHC is illuminated at only 1.5 mW/cm<sup>2</sup> by an 740 nm LED.

As a general rule our developments, IPs, principle circuitry and range of Integrated Circuits are suitable and specifically designed for appropriate use in technical applications, such as in devices, systems and any kind of technical equipment, in so far as they do not infringe existing patent rights. In principle the range of use is limitless in a technical sense and refers to the products listed in the inventory of goods compiled for the 2008 and following export trade statistics issued annually by the Bureau of Statistics in Wiesbaden, for example, or to any product in the product catalogue published for the 2007 and following exhibitions in Hanover (Hannover-Messe).

We understand suitable application of our published designs to be state-of-the-art technology which can no longer be classed as inventive under the stipulations of patent law. Our explicit application notes are to be treated only as mere examples of the many possible and extremely advantageous uses our products can be put to.
