

WM8725

99dB Stereo DAC

Production Data, July 2000, Rev 2.0

DESCRIPTION

WM8725 is a high-performance stereo DAC designed for use in portable audio equipment, video CD players and similar applications. It comprises selectable normal or I²S compatible serial data interfaces for 16 to 24-bit digital inputs, high performance digital filters, and sigma-delta output DACs, achieving an excellent 99dB signal-to-noise performance.

The device is available in a 14-pin SO package that offers selectable mute and de-emphasis functions using a minimum of external components.

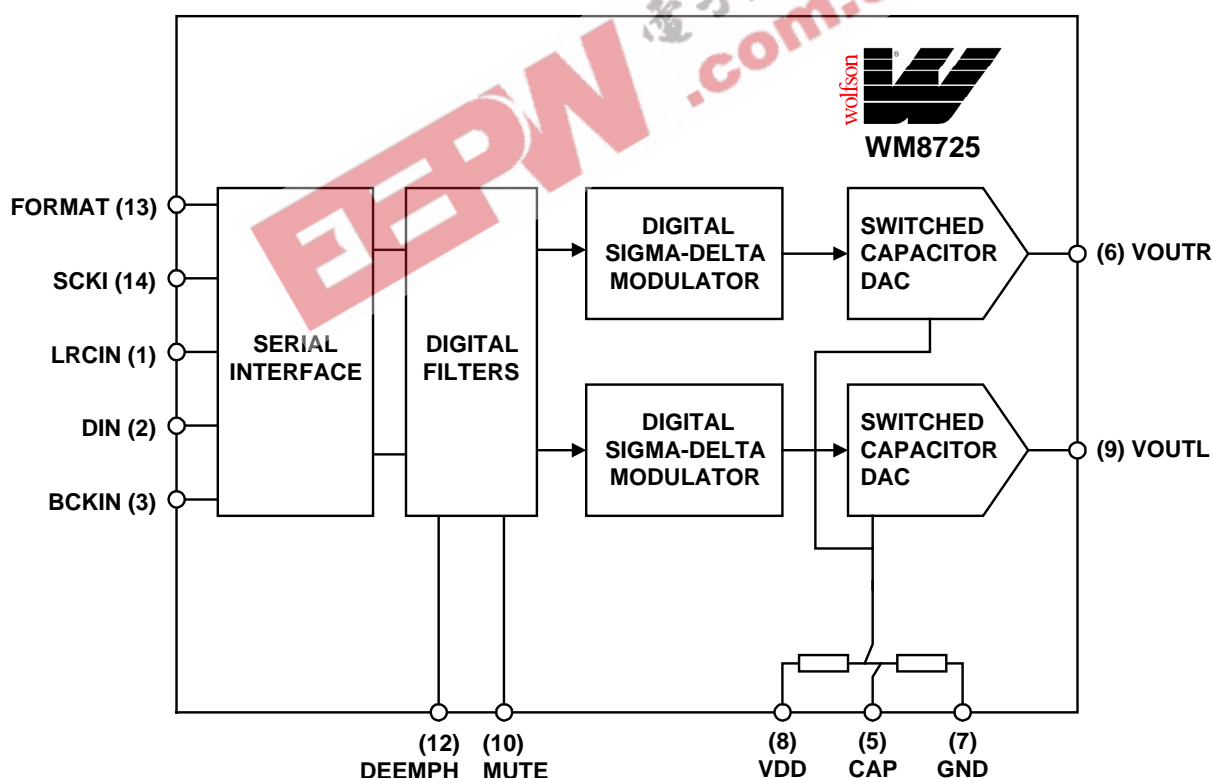

FEATURES

- Compatible with PCM1725
- 99dB SNR performance
- Stereo DAC with input sampling from 8kHz to 96kHz
- Additional mute feature
- Normal or I²S compatible data format
- Sigma-delta design with 64x oversampling
- System clock 256fs or 384fs
- Supply range 3V to 5V
- 14-pin SOIC package

APPLICATIONS

- Portable audio equipment
- Video CD players

PIN CONFIGURATION

ORDERING INFORMATION

DEVICE	TEMP. RANGE	PACKAGE
WM8725ED	-25 to +85°C	14-pin SOIC

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings are stress ratings only. Permanent damage to the device may be caused by continuously operating at or beyond these limits. Device functional operating limits and guaranteed performance specifications are given under Electrical Characteristics at the test conditions specified.

ESD Sensitive Device. This device is manufactured on a CMOS process. It is therefore generically susceptible to damage from excessive static voltages. Proper ESD precautions must be taken during handling and storage of this device.

CONDITION	MIN	MAX
Supply voltage	-0.3V	+7.0V
Reference input		VCC+0.3V
Operating temperature range, T _A	-25°C	+85°C
Storage temperature	-65°C	+150°C
Lead temperature (soldering, 10 seconds)		+260°C
Lead temperature (soldering, 2 minutes)		+183°C

RECOMMENDED OPERATING CONDITIONS

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Supply Range	VDD		-10%	3.0 to 5.0	+10%	V
Ground	GND			0		V
Supply Current		VDD = 5V		15	25	mA
		VDD = 3V		7.5		mA

ELECTRICAL CHARACTERISTICS

Test Conditions

$V_{DD} = 5V$, $GND = 0V$, $T_A = +25^{\circ}C$, $f_s = 48kHz$, $SCKI = 256fs$ unless otherwise stated.

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Digital Logic Levels						
Input LOW level	V_{IL}				0.8	V
Input HIGH level	V_{IH}		2.0			V
Analogue Output Levels						
Minimum resistance load		To midrail or AC coupled (5V supply)		1		kohms
		To midrail or AC coupled (3V supply)		1		kohms
Maximum capacitance load		5V or 3V		100		pF
Output DC level				$V_{DD}/2$		V
Reference Levels						
Potential divider resistance		V_{DD} to CAP and CAP to GND	80	100	120	kohms
Voltage at CAP		$V_{DD} = 5V$	2.3	2.5	2.7	V
DAC Circuit Specifications						
SNR (Note 1)		$V_{DD} = 5V$	90	99		dB
		$V_{DD} = 3V$		97		dB
Full scale output voltage		Into 10kohm $V_{DD} = 5V$, 0dB	0.9	1.0	1.1	V_{RMS}
		Into 10kohm $V_{DD} = 3V$, 0dB		0.6		V_{RMS}
THD (Full scale)		0dB		0.01	0.02	%
THD+N (Dynamic range)		-60dB		92		dB
Frequency response			0		20,000	Hz
Transition band			20,000			Hz
Out of band rejection				-40		dB
Channel Separation				90		dB
Gain mismatch channel-to-channel				± 1	± 5	%FSR
Audio Data Input and System Clock Timing Information						
BCKIN pulse cycle time	t_{BCY}		100			ns
BCKIN pulse width high	t_{BCH}		50			ns
BCKIN pulse width low	t_{BCL}		50			ns
BCKIN rising edge to LRCIN edge	t_{BL}		30			ns
LRCIN rising edge to BCKIN rising edge	t_{LB}		30			ns
DIN setup time	t_{DS}		30			ns
DIN hold time	t_{DH}		30			ns
System clock pulse width high	t_{SCKIH}		13			ns
System clock pulse width low	t_{SCKIL}		13			ns

Notes:

- Ratio of output level with 1kHz full scale input, to the output level with all zeros into the digital input, measured "A" weighted over a 20Hz to 20kHz bandwidth.
- All performance measurements done with 20kHz low pass filter. Failure to use such a filter will result in higher THD+N and lower SNR and Dynamic Range readings than are found in the Electrical Characteristics. The low pass filter removes out of band noise; although it is not audible, it may affect dynamic specification values.

PIN DESCRIPTION

PIN	NAME	TYPE	DESCRIPTION
1	LRCIN	Digital input	Sample rate clock input
2	DIN	Digital input	Serial data input
3	BCKIN	Digital input	Bit clock input
4	NC	No connect	No internal connection
5	CAP	Analogue output	Analogue internal reference
6	VOUTR	Analogue output	Right channel DAC output
7	GND	Supply	0V supply
8	VDD	Supply	Positive supply
9	VOUTL	Analogue output	Left channel DAC output
10	MUTE	Digital input	Mute control, high = muted. Internal pull-down
11	NC	No connect	No internal connection
12	DEEMPH	Digital input	De-emphasis select, high = de-emphasis ON. Internal pull-up
13	FORMAT	Digital input	Data input format select, low = normal, high = I ² S. Internal pull-up
14	SCKI	Digital input	System clock input (256fs or 384fs)

DEVICE DESCRIPTION

INTRODUCTION

WM8725 is a complete stereo audio 16-bit digital-to-analogue converter, including digital interpolation filter, multibit sigma-delta with dither, and switched capacitor multibit stereo DAC and output smoothing filters.

Special functions of mute and de-emphasis are provided, and operation using system clock of 256fs or 384fs is provided, selection between either clock rate being automatically controlled. Sample rates (fs) from less than 8ks/s to 96ks/s are allowed, provided the appropriate system clock is input.

MUTE	DESCRIPTION
0	Mute is OFF
1	Mute is ON

Table 1 Mute Control

A novel multi bit sigma-delta DAC design is used, utilising a 64x oversampling rate, to optimise signal to noise performance and offer increased clock jitter tolerance.

Internally generated midrail references are used to DC bias output signals, requiring only a single external capacitor for decoupling purposes.

The device is packaged in a small 14-pin SOIC package, offering pin compatibility with Burr Brown PCM1725, but with added functionality of a mute input pin, which may be left floating if unused, or held 'low' leaving the device operational.

Single 3V to 5V supplies may be used, the output amplitude scaling with absolute supply level. Low supply voltage operation and low current consumption, and the low pin count small package, make the WM8725 attractive for many consumer type applications.

DAC CIRCUITS

The WM8725 DACs are designed to allow playback of 16-bit PCM audio or similar data with high resolution and low noise and distortion. Sample rates up to 96ks/s may be used, with much lower sample rates acceptable provided that the ratio of sample rate (LRCIN) to system clock is maintained at the required 256fs or 384fs times.

The DACs on WM8725 are implemented using sigma-delta oversampled conversion techniques. These require that the PCM samples are digitally filtered and interpolated to generate a set of samples at a much higher rate than the 96ks/s input rate. This sample stream is then digitally modulated to generate a digital pulse stream that is then converted to analogue signals in a switched capacitor DAC. The advantage of this technique is that the DAC is linearised using noise shaping techniques, allowing the 16 bit resolution to be met using non-critical analogue components. A further advantage is that the high sample rate at the DAC output means that smoothing filters on the output of the DAC need only have fairly crude characteristics in order to remove the characteristic steps, or images, on the output of the DAC. To ensure that generation of tones characteristic to sigma-delta converters is not a problem, dithering is used in the digital modulator and a higher order modulator is used. The switched capacitor technique used in the DAC reduces sensitivity to clock jitter compared to switched current techniques used in other implementations.

De-emphasis of 44.1kHz signals may be applied if required.

DEEMPH	DESCRIPTION
0	De-emphasis is OFF
1	De-emphasis is ON

Table 2 De-emphasis Control

The voltage on the CAP pin is used as the reference for the DACs, therefore the amplitude of the signals at the DAC outputs will scale with the amplitude of the voltage at the CAP. An external reference could be used to drive into the CAP pin if desired, but a value typically of about midrail should be used for optimum performance.

The outputs of the 2 DACs are buffered out of the device by buffer amplifiers. These amplifiers will source load current of several mA and sink current up to 1.5mA, so allowing significant loads to be driven. The output source is active and the sink is Class A, i.e. fixed value, so greater loads might be driven if an external 'pull-down' resistor is connected at the output.

Typically an external low pass filter circuit will be used to remove residual sampling noise of the 64x oversampling used and if desired adjust the signal amplitude and device strength.

SERIAL DATA INTERFACE

WM8725 has serial interface formats that are fully compatible with both normal (MSB first, right-justified) and I²S interfaces. The data format is selected with the FORMAT pin. When FORMAT is LOW, normal data format is selected. When the format is HIGH, I²S format is selected. It must be noted that in "packed" mode operation (exactly 32 BCLKs per LRCIN period), the data word must align exactly with LRCIN clock edges (effectively both left and right justified at the same time). This is true in both normal and I²S modes.

FORMAT	DESCRIPTION
0	Normal format (MSB-first, right justified)
1	I ² S format (Philips serial data protocol)

Table 3 Serial Interface Formats

SYSTEM CLOCK

The system clock is used to operate the digital filters and the noise shaping circuits. The system clock input is at pin 14 (SCKI). The frequency of WM8725's system clock should be set to 256fs or 384fs, (where fs is the audio sampling frequency). The sample rate is typically: 32 kHz, 44.1 kHz, 48 kHz or 96kHz.

WM8725 has a system clock detection circuit that automatically determines whether the system clock being supplied is at 256fs or 384fs. The system clock should be synchronised with LRCIN, but WM8725 is tolerant of phase differences. Severe distortion in the phase difference between LRCIN and the system clock will be detected, and cause the device to automatically resynchronise. During resynchronisation, the output of the device will either repeat the previous sample, or drop the next sample, depending on the nature of the phase slip. This will ensure minimal "click" at the analogue outputs during resynchronisation.

Figure 3 System Clock Timing Requirements

SAMPLING RATE (LRCIN)	SYSTEM CLOCK FREQUENCY (MHz)	
	256fs	384fs
32 kHz	8.192	12.288
44.1 kHz	11.2896	16.9340
48 kHz	12.288	18.432
96kHz	24.576	36.864

RECOMMENDED EXTERNAL COMPONENTS

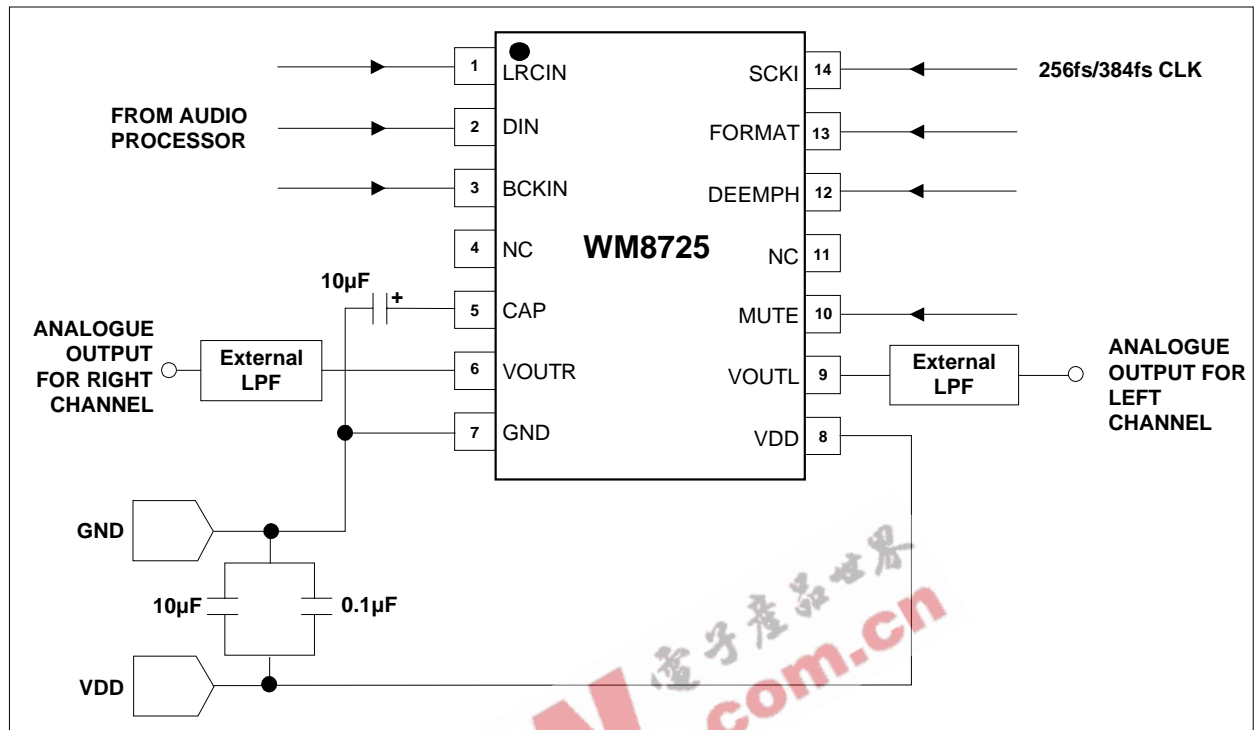

Figure 5 Recommended External Components

DETAIL OF RECOMMENDED EXTERNAL COMPONENTS SHOWING THE EXTERNAL LOW PASS FILTER

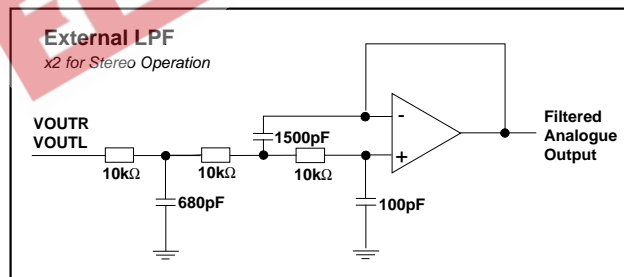

Figure 6 Third-Order Low Pass Filter (LPF) Example

An external low pass filter is recommended (see Figure 6) if the device is driving a wideband amplifier. In some applications, second-order or passive RC filter may be adequate.

PCB LAYOUT

1. Place all supply decoupling capacitors as close as possible to their respective supply pins and provide a low impedance path from the capacitors to the appropriate ground.
2. Separate analogue and digital ground planes should be situated under respective analogue and digital device pins.
3. Avoid noise on the CAP reference pin. The decoupling capacitor should be placed as close to this pin as possible with a low impedance path from the capacitor to analogue ground.
4. Digital input signals should be screened from each other and from other sources of noise to avoid cross-talk and interference. They should also run over the digital ground plane to avoid introducing unwanted noise into the analogue ground plane.
5. Analogue output signal tracks should be kept as short as possible and over the analogue ground plane reducing the possibility of losing signal quality.
