

24-Bit, 192kHz Stereo ADC

DESCRIPTION

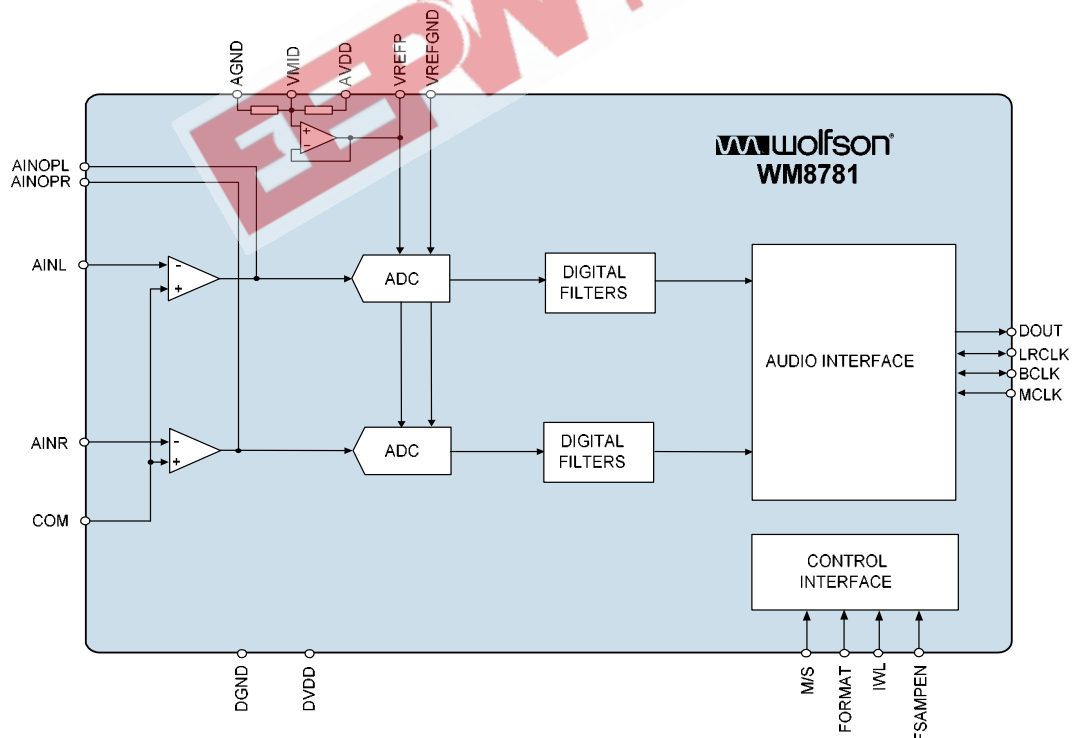

The WM8781 is a high performance, low cost stereo audio ADC designed for recordable media applications.

The device offers stereo line level inputs along with two control input pins (FORMAT, IWL) to allow operation of the audio interface in three industry standard modes. An internal op-amp is integrated on the front end of the chip to accommodate analogue input signals greater than $1V_{rms}$. The device also has a high pass filter to remove residual DC offsets.

WM8781 offers Master or Slave mode clocking schemes. A control input pin M/S is used to allow Slave mode operation or Master mode operation. A stereo 24-bit multi-bit sigma-delta ADC is used with 128x, 64x or 32x oversampling, according to sample rate. Digital audio output word lengths from 16-24 bits and sampling rates from 8kHz to 192kHz are supported.

The device is a hardware controlled device and is supplied in a 20-lead SSOP package.

BLOCK DIAGRAM

FEATURES

- SNR 102dB ('A' weighted @ 48kHz)
- THD -90dB (at -1dB)
- Sampling Frequency: 8 – 192kHz
- Master or Slave Clocking Mode
- System Clock (MCLK): 128fs, 192fs, 256fs, 384fs, 512fs, 768fs
- Audio Data Interface Modes
 - 16-24 bit I²S, 16-24 bit Left, 16-24 bit Right Justified
- Supply Voltages
 - Analogue 2.7 to 5.5V
 - Digital core: 2.7V to 3.6V
- 20-lead SSOP package

APPLICATIONS

- Recordable DVD Players
- Personal Video Recorders
- STB
- Studio Audio Processing Equipment

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings are stress ratings only. Permanent damage to the device may be caused by continuously operating at or beyond these limits. Device functional operating limits and guaranteed performance specifications are given under Electrical Characteristics at the test conditions specified.

ESD Sensitive Device. This device is manufactured on a CMOS process. It is therefore generically susceptible to damage from excessive static voltages. Proper ESD precautions must be taken during handling and storage of this device.

Wolfson tests its package types according to IPC/JEDEC J-STD-020B for Moisture Sensitivity to determine acceptable storage conditions prior to surface mount assembly. These levels are:

MSL1 = unlimited floor life at 30°C / 85% Relative Humidity. Not normally stored in moisture barrier bag.

MSL2 = out of bag storage for 1 year at 30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

MSL3 = out of bag storage for 168 hours at 30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

The Moisture Sensitivity Level for each package type is specified in Ordering Information.

CONDITION	MIN	MAX
Digital supply voltage	-0.3V	+3.63V
Analogue supply voltage	-0.3V	+7V
Voltage range digital inputs	DGND -0.3V	DVDD + 0.3V
Voltage range analogue inputs	AGND -0.3V	AVDD +0.3V
+Operating temperature range, T_A	-25°C	+85°C
Storage temperature after soldering	-65°C	+150°C

Notes

- Analogue and digital grounds must always be within 0.3V of each other.

RECOMMENDED OPERATING CONDITIONS

Supply Current						
Analogue supply current		AVDD = 5V		32		mA
Digital supply current		DVDD = 3.3V		5		mA
Power Down				0.5		mA

Notes:

- All performance measurements are done with a 20kHz low pass filter, and where noted an A-weight filter. Failure to use such a filter will result in higher THD+N and lower SNR and Dynamic Range readings than are found in the Electrical Characteristics. The low pass filter removes out of band noise; although this is not audible, it may affect dynamic specification values.
- VMID is decoupled with 10uF and 0.1uF capacitors close to the device package. Smaller capacitors may reduce performance.
- This high leakage current is due to the topology of the instate pads. The pad input is connected to the midpoint of an internal resistor string to pull input to vmid if undriven.

TERMINOLOGY

- Signal-to-noise ratio (dB) – Ratio of output level with 1kHz full scale input, to the output level with all zeros into the digital input, over a 20Hz to 20kHz bandwidth. (No Auto-zero or Automute function is employed in achieving these results).
- Dynamic range (dB) – DR is a measure of the difference between the highest and lowest portions of a signal. Normally a THD+N measurement at 60dB below full scale. The measured signal is then corrected by adding the 60dB to it. (e.g. THD+N @ -60dB= -32dB, DR= 92dB).
- THD+N (dB) – THD+N is a ratio, of the rms values, of (Noise + Distortion)/Signal.
- Channel Separation (dB) – Also known as Cross-Talk. This is a measure of the amount one channel is isolated from the other. Normally measured by sending a full scale signal down one channel and measuring the other.

SIGNAL TIMING REQUIREMENTS

Note:

LRCLK should be synchronous with MCLK, although the WM8781 interface is tolerant of phase variations or jitter on these signals.

DEVICE DESCRIPTION

INTRODUCTION

The WM8781 is a stereo 24-bit ADC designed for demanding recording applications such as DVD recorders, studio mixers, PVRs, and AV amplifiers. The WM8781 consists of stereo line level inputs, followed by a sigma-delta modulator and digital filtering.

The device offers stereo line level inputs along with two control input pins (FORMAT, IWL) to allow operation of the audio interface in three industry standard modes (left justified, right justified or I²S). An internal op-amp is integrated on the front end of the chip to accommodate analogue input signals greater than 1V_{rms}. The device also has a high pass filter to remove residual DC offsets.

The WM8781 offers Master or Slave mode clocking schemes. A control input pin M/S is used to allow Slave mode or Master mode operation. The WM8781 supports master clock rates from 128fs to 768fs and digital audio output word lengths from 16-24 bits. Sampling rates from 8kHz to 192kHz are supported, delivering high SNR operating with 128x, 64x or 32x over-sampling, according to the sample rate.

The line inputs are biased internally through the operational amplifier to V_{MID}.

ADC

The WM8781 uses a multi-bit over sampled sigma-delta ADC. A single channel of the ADC is illustrated in Figure 4 Multi-Bit Oversampling Sigma Delta ADC Schematic.

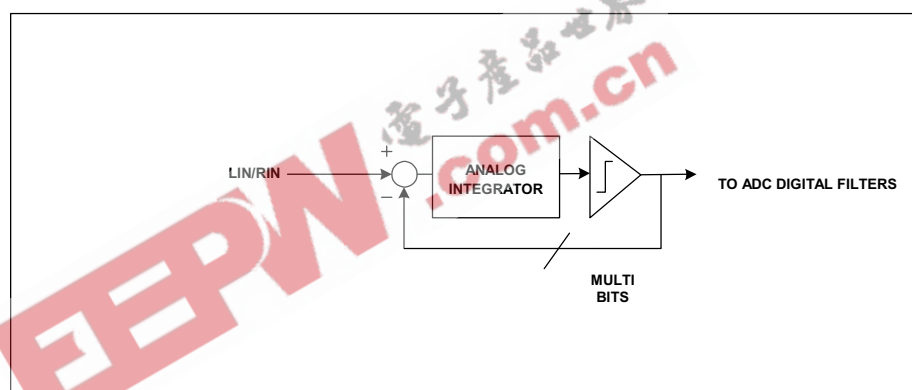

Figure 4 Multi-Bit Oversampling Sigma Delta ADC Schematic

The use of multi-bit feedback and high oversampling rates reduces the effects of jitter and high frequency noise.

The ADC Full Scale input is 1.0V rms at AVDD = 5.0 volts. Any input voltage greater than full scale will possibly overload the ADC and cause distortion. Note that the full scale input has a linear relationship with AVDD. The internal op-amp and appropriate resistors can be used to reduce signals greater than 1V_{rms} before they reach the ADC.

The ADC filters perform true 24 bit signal processing to convert the raw multi-bit oversampled data from the ADC to the correct sampling frequency to be output on the digital audio interface.

ADC DIGITAL FILTER

The ADC digital filters contain a digital high pass filter. The high-pass filter response detailed in Digital Filter Characteristics. The operation of the high pass filter removes residual DC offsets that are present on the audio signal.

DIGITAL AUDIO INTERFACE

The digital audio interface uses three pins:

- DOUT: ADC data output
- LRCLK: ADC data alignment clock
- BCLK: Bit clock, for synchronisation

The digital audio interface takes the data from the internal ADC digital filters and places it on DOUT and LRCLK. DOUT is the formatted digital audio data stream output from the ADC digital filters with left and right channels multiplexed together. LRCLK is an alignment clock that controls whether Left or Right channel data is present on the DOUT line. DOUT and LRCLK are synchronous with the BCLK signal with each data bit transition signified by a BCLK high to low transition. DOUT is always an output. BCLK and LRCLK may be inputs or outputs depending whether the device is in Master or Slave mode. (see Master and Slave Mode Operation, below).

Three different audio data formats are supported:

- Left justified
- Right justified
- I²S

MASTER AND SLAVE MODE OPERATION

The WM8781 can be configured as either a master or slave mode device. As a master device the WM8781 generates BCLK and LRCLK and thus controls sequencing of the data transfer on DOUT. In slave mode, the WM8781 responds with data to clocks it receives over the digital audio interface. The mode can be selected by setting the MS input pin (see Table 4 Master/Slave selection below). Master and slave modes are illustrated below.

Figure 5 Master Mode

Figure 6 Slave Mode

PIN	DESCRIPTION

Table 4 Master/Slave selection

AUDIO INTERFACE CONTROL

The Input Word Length and Audio Format mode can be selected by using IWL and FORMAT pins.

PIN	DESCRIPTION
IWL	Word Length 0 = 16 bit 1 = 20 bit Z = 24 bit
FORMAT	Audio Mode Select 0 = RJ 1 = LJ Z = I ² S

Table 5 Audio Data Format Control

AUDIO DATA FORMATS

In Left Justified mode, the MSB is available on the first rising edge of BCLK following an LRCLK transition. The other bits up to the LSB are then transmitted in order. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles before each LRCLK transition.

Figure 7 Left Justified Audio Interface (assuming n-bit word length)

In Right Justified mode, the LSB is available on the last rising edge of BCLK before an LRCLK transition. All other bits are transmitted before (MSB first). Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles after each LRCLK transition.

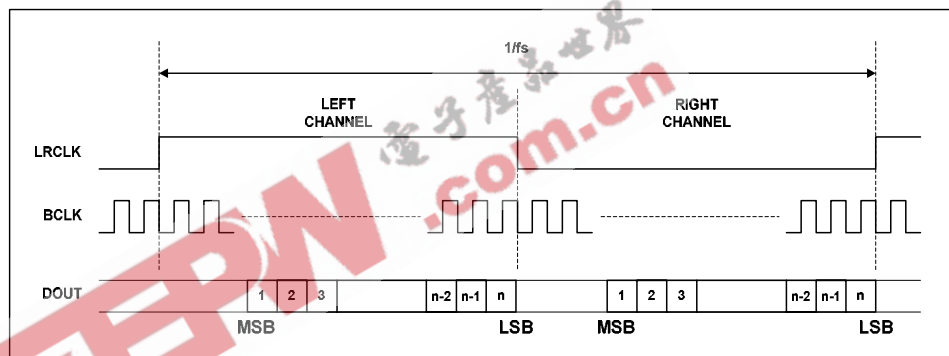

Figure 8 Right Justified Audio Interface (assuming n-bit word length)

In I²S mode, the MSB is available on the second rising edge of BCLK following an LRCLK transition. The other bits up to the LSB are then transmitted in order. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles between the LSB of one sample and the MSB of the next.

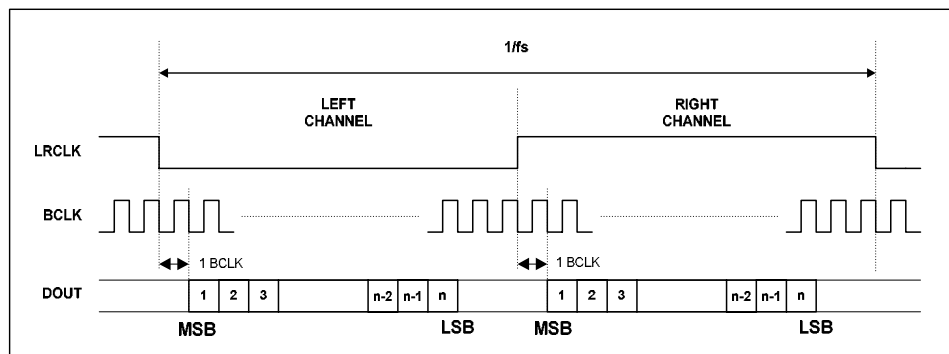

Figure 9 I²S Audio Interface (assuming n-bit word length)

MASTER CLOCK AND AUDIO SAMPLE RATES

In a typical digital audio system there is only one central clock source producing a reference clock to which all audio data processing is synchronised. This clock is often referred to as the audio system's Master Clock (MCLK). The external master system clock can be applied directly through the MCLK input pin. In a system where there are a number of possible sources for the reference clock it is recommended that the clock source with the lowest jitter be used to optimise the performance of the ADC.

The master clock is used to operate the digital filters and the noise shaping circuits. The WM8781 supports master clocks of 128fs, 192fs, 256fs, 384fs, 512fs and 768fs, where fs is the audio sampling frequency (LRCLK). In Slave Mode, the WM8781 automatically detects the audio sample rate. In Master Mode, LRCLK is generated for rate 384fs, unless the user changes this to 192fs using the FSAMPEN pin = z (see Table 7 below). BCLK is also generated in Master Mode, where BCLK=64fs.

Table 6 shows the common MCLK frequencies for different sample rates.

SAMPLING RATE (LRCLK)	Master Clock Frequency (MHz)					
	128fs	192fs	256fs	384fs	512fs	768fs
8kHz	1.024	1.536	2.048	3.072	4.096	6.144
16kHz	2.048	3.072	4.096	6.144	8.192	12.288
32kHz	4.096	6.144	8.192	12.288	16.384	24.576
44.1kHz	5.6448	8.467	11.2896	16.9340	22.5792	33.8688
48kHz	6.144	9.216	12.288	18.432	24.576	36.864
96kHz	12.288	18.432	24.576	36.864	-	-
192kHz	24.576	36.864	-	-	-	-

Table 6 Master Clock Frequency Selection

In Slave mode, the WM8781 has a master detection circuit that automatically determines the relationship between the master clock frequency and the sampling rate (to within +/- 32 system clocks). If there is a greater than 32 clocks error the interface sets itself to the highest rate available (768fs). There must be a fixed number of MCLKs per LRCLK, although the WM8781 is tolerant of phase variations or jitter on these clocks.

The WM8781 can operate at sample rates from 8kHz to 192kHz. The WM8781 uses a sigma-delta modulator that operates at a fixed frequency of 6.144MHz (128 x LRCLK oversampling @ 48kHz sampling rate). For correct operation of the device and optimal performance, the user must set the appropriate ADC modulator sampling rate enable. In both Master and Slave Modes, it is recommended that for 96kHz the user sets FSAMPEN to 1, and for 192kHz set FSAMPEN to z. For Master Mode 192kHz, FSAMPEN set to z is a requirement.

PIN	DESCRIPTION
M/S	Master/Slave Selection 0 = Slave Mode (128fs, 192fs, 256fs, 384fs, 512fs, 768fs) 1 = Master Mode (384fs, 192fs when FSAMPEN=z)
FSAMPEN	Fast sampling rate enable 0 = 48kHz enable (128x OSR) 1 = 96kHz enable (64x OSR) z = 192kHz enable (32x OSR)

Table 7 Master/Slave and Sampling Rate Enable Selection

POWER DOWN CONTROL

The WM8781 can be powered down by stopping MCLK. Power down mode using MCLK is entered after 65536/fs clocks. On power-up, the WM8781 applies the power-on reset sequence described below.

When MCLK is stopped DOUT is forced to zero.

POWER ON RESET

Figure 10 Power Supply Timing Requirements – power-on

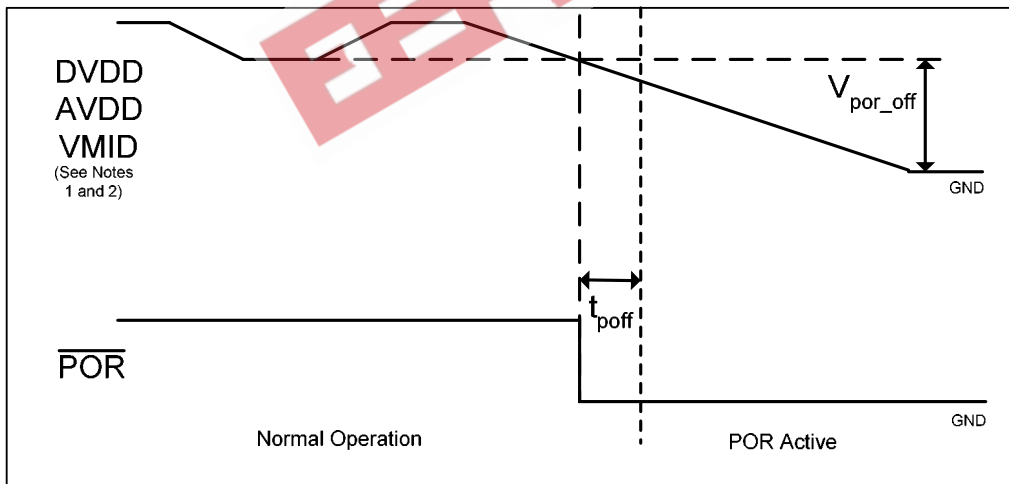

Figure 11 Power Supply Timing Requirements – power-down

Test ConditionsAVDD = 5V, DVDD = 3.3V, AGND = DGND = 0V, T_A = +25°C

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power Supply Input Timing Information						
DVDD level to activate POR – power on	V _{pora}	Measured from DGND		0.7		V
AVDD level to activate POR – power on	V _{pora}	Measured from AGND		0.7		V
VMID level to activate POR – power on	V _{pora}	Measured from AGND		0.7		V
DVDD level to release POR – power on (see notes 1 and 2)	V _{porr}	Measured from DGND		DVDD Min		V
AVDD level to release POR – power on (see notes 1 and 2)	V _{porr}	Measured from AGND		AVDD Min		V
VMID level to release POR – power on (see notes 1 and 2)	V _{porr}	Measured from AGND		1		V
POR active period (see notes 1 and 2)	t _{por}	Measured from POR active to POR release	30 (note 6)	Defined by DVDD/AVDD/ VMID Rise Time		μs
DVDD level to activate POR – power off (see note 5)	V _{por_off}	Measured from DGND		0.8		V
AVDD level to activate POR – power off (see note 5)	V _{por_off}	Measured from AGND		0.8		V
VMID level to activate POR – power off (see note 5)	V _{por_off}	Measured from AGND		0.7		V
Power on - POR propagation delay through device	t _{pon}	Measured from rising EDGE of POR		30		μs
Power down - POR propagation delay through device	t _{poff}	Measured from falling EDGE of POR		30		μs

Notes:

- POR is activated when DVDD or AVDD or VMID reach their stated V_{pora} level (Figure 10).
- POR is only released when DVDD and AVDD and VMID have all reached their stated V_{porr} levels (Figure 10).
- The rate of rise of VMID depends on the rate of rise of AVDD, the internal 50kΩ resistance and the external decoupling capacitor. Typical tolerance of 50K resistor can be taken as +/-20%.
- If AVDD, DVDD or VMID suffer a brown-out (i.e. drop below the minimum recommended operating level but do not go below V_{por_off}), then the chip will not reset and will resume normal operation when the voltage is back to the recommended level again.
- The chip will enter reset at power down when AVDD or DVDD or VMID falls below V_{por_off}. This may be important if the supply is turned on and off frequently by a power management system.
- The minimum t_{por} period is maintained even if DVDD, AVDD and VMID have zero rise time. This specification is guaranteed by design rather than test.

DIGITAL FILTER CHARACTERISTICS

The WM8781 digital filter characteristics scale with sample rate.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
ADC Sample Rate (Single Rate – 48kHz typically)

 - D. MEETS JEDEC.95 MO-150, VARIATION = AE. REFER TO THIS SPECIFICATION FOR FURTHER DETAILS.

IMPORTANT NOTICE

Wolfson Microelectronics plc (WM) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current. All products are sold subject to the WM terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

WM warrants performance of its products to the specifications applicable at the time of sale in accordance with WM's standard warranty. Testing and other quality control techniques are utilised to the extent WM deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

In order to minimise risks associated with customer applications, adequate design and operating safeguards must be used by the customer to minimise inherent or procedural hazards. Wolfson products are not authorised for use as critical components in life support devices or systems without the express written approval of an officer of the company. Life support devices or systems are devices or systems that are intended for surgical implant into the body, or support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided, can be reasonably expected to result in a significant injury to the user. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

WM assumes no liability for applications assistance or customer product design. WM does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of WM covering or relating to any combination, machine, or process in which such products or services might be or are used. WM's publication of information regarding any third party's products or services does not constitute WM's approval, license, warranty or endorsement thereof.

Reproduction of information from the WM web site or datasheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations and notices. Representation or reproduction of this information with alteration voids all warranties provided for an associated WM product or service, is an unfair and deceptive business practice, and WM is not responsible nor liable for any such use.

Resale of WM's products or services with statements different from or beyond the parameters stated by WM for that product or service voids all express and any implied warranties for the associated WM product or service, is an unfair and deceptive business practice, and WM is not responsible nor liable for any such use.
